

**Elementary Math  
for Computer Science**  
with Python

Eric Bennett

**Eric Bennett** has taught mathematics in public and private schools in the Austin, Texas, area since 2005. He is the founder and director of Future Set Tech Camp, a summer program for computer science education.

**Variables**

*Image credit: Carol M. Highsmith*

The height of a tree could be represented by a variable because it changes over time.

## **Introduction**

Some things never change: the number of inches in a foot; the number of petals on a tulip; the speed of light. Quantities like these are known as constants.

Other things change frequently: the day of the week; the height of a tree; a person's age. Quantities like these are best represented

## Examples

### Addition with variables

**Q:** Find the value of the variable:

$$6 + x = 10$$

**A:** Using the ten-frames above, we can see that 4 tiles must be added to the left side in order to match the total of 10 tiles on the right side.

In other words, since  $6 + 4 = 10$ , the value of  $x$  must be 4.

# Practice

1. Use the tile models to find the value of the variable.

a.  $4 + a = 9$

b.  $b + 2 = 7$

c.  $6 + c = 9$

d.  $7 - d = 4$

## Negative Numbers

The climate in Austin, Texas is much warmer than in Boise, Idaho.

Image credit: Carol M. Highsmith

7. **The coldest recorded temperature** in Boise, Idaho occurred on December 23rd, 1990. On that day, the temperature reached  $-25^{\circ}\text{F}$ . The coldest recorded temperature in Austin, Texas occurred on February 2nd, 2011. On that day, the temperature reached  $17^{\circ}\text{F}$ . How many degrees warmer is the record-low in Austin than the record-low in Boise?
  
8. **To create branches in a computer program** that lead to different outcomes, a programmer will often use "if-then" constructs. For example: *If* the player completes a challenge before the time expires, *then* the player earns a perfect score. Complete the following "if-then" constructs about absolute values:
  - a. If a number is positive, then its absolute value is...
  - b. If a number is negative, then its absolute value is...
  - c. If two numbers have the same absolute value, then the numbers are...

## Examples

### Adding negative numbers

**Q:** Evaluate:  $-5 + 3$

**A:** Adding a positive results in a move to the right on the number line. Thus:

$$-5 + 3 = -2$$

**Q:** Evaluate:  $5 + (-3)$

**A:** Adding a negative results in a move to the left on the number line. Thus:

$$5 + (-3) =$$

$$5 - 3 = 2$$

# Practice

1. Use the number lines to find each sum.

a.  $-3 + 2$

b.  $3 + (-2)$

c.  $-1 + 4$

*Adding and Subtracting Negative Numbers*

**d.**  $2 + (-2)$

**e.**  $2 + (-8)$

**f.**  $-8 + 9$

**g.**  $-2 + (-5)$

**h.**  $6 + (-3)$

**2. Find the sum. If you get stuck, try plotting points on a number line.**

**a.**  $-1 + 1$

**f.**  $-7 + 6$

**k.**  $17 + (-8)$

**b.**  $-2 + 4$

**g.**  $8 + (-9)$

**l.**  $13 + (-20)$

**c.**  $3 + (-1)$

**h.**  $-4 + 12$

**m.**  $-22 + 27$

**d.**  $4 + (-3)$

**i.**  $6 + (-10)$

**n.**  $15 + (-30)$

**e.**  $-3 + (-5)$

**j.**  $-11 + 5$

**o.**  $21 + (-32)$

**3. Sperm whales are known to dive** incredibly deep in search of squid. Imagine that a sperm whale dives to a depth of 2,100 ft (-2,100 ft). Still searching for squid, it dives a further 1,080 ft to its maximum observed diving depth. Use integer addition to find the maximum observed diving depth of a sperm whale.

## **24 Game comprehension questions**

1. How would you print the first item from a list named "movies"?
2. How would you print every item from a list named "movies"?
3. Describe the output from the following code:

```
answer = "3 + 4 * 5"  
print(answer)  
print(eval(answer))
```

## Challenge!

After completing *24 Game* in Python, try these additional challenges:

1. Change the game to the *36 Game*.
2. Allow the user to keep guessing until they win the game.
3. Write a program that selects a random name from a list of five names.
4. In our *24 Game*, it is possible for the user to trick the computer by entering numbers not given or by omitting some of the given numbers. For a solution to this problem, see *Extension: 24 Game in Python* in the appendix.
